

Proven Performance

Fast Enterprises (FAST) offers production-proven, commercial-off-the-shelf software for member jurisdictions to effectively administer the International Fuel Tax Agreement (IFTA). Our IFTA software provides licensing, reporting, filing, auditing, and transmittal functions. It also provides motor carriers and their authorized representatives with online tools that support efficient and accurate carrier reporting and compliance.

The FAST IFTA solution automates processes that are configured to meet distinct jurisdictional requirements, alleviate agency workload, and comply with IFTA program guidelines. It contains interface functionality for the IFTA Clearinghouse and external data-sharing capabilities for motor carriers and commercial vehicles, such as the federal Safety and Fitness Electronic Records (SAFER) system and Commercial Vehicle Information Exchange Window (CVIEW) systems. It also integrates with other agency programs managed by FAST software, such as International Registration Plan (IRP), fuel tax, and other revenue, license, and registration programs. This provides agencies with a single solution for the administration of multiple lines of government business.

International Fuel Tax Agreement

The **FAST** Solution for IFTA Administration

Efficient Automation

Fast Enterprises' (FAST's) software streamlines agencies' administration of multiple government programs. Our IFTA solution automates the administration of initial and renewal IFTA licensing, funds netting, and the electronic transmission of demographic data, tax returns, and audit information. The software also supports the automated generation and distribution of renewal applications and non-renewal follow-up correspondence. Paper-based reporting, billing, and payment correspondence are also supported for non-Clearinghouse members.

Revenue management and accounting functionality automate the calculation of applicable license and decal fees, and decal inventory-management functionality supports the detection of fraudulent decals. Issued, canceled, damaged, lost, or stolen decals are managed and tracked by the software throughout the decal lifecycle.

Key Functions and Features

- IFTA program compliance and uniformity
- IFTA licensing and renewals
- Decal inventory control and issuance
- Correspondence for renewal reminders and follow-ups
- Demographic data interface with the IFTA Clearinghouse
- Generation and processing of IFTA returns
- Real-time view of transmittal statuses
- Quarterly import of fuel tax and surcharge rates
- Automated funds netting and transmittals
- Support for optional paper-based transmittals
- Online customer self-service features
- Audit management, execution, and transmittal
- Correspondence management
- Payments, refunds, billing, collections, and revenue accounting
- Reporting, query, analytics, and fraud detection tools
- Integrated security, workflow, and document management

Reliable Validation

Our software facilitates compliance with IFTA program rules, policies, and uniformity measures. It identifies erroneous or fraudulent data, providing agencies with confidence in the validity of licensing and reporting data. It flags inconsistencies such as those in tax-paid fuel and fuel consumed, the reporting of identical fuel consumption rates in multiple quarters, operation in non-contiguous jurisdictions, and non-operation in the base jurisdiction.

Error-correction and fraud-detection business rules are configurable and can account for jurisdiction-specific circumstances based on geography and relative tax rates. Integrated online customer self-service features increase operational efficiency and minimize filing errors by alerting customers to inconsistent or erroneous entries in returns.

When used to administer both IFTA and IRP, our software improves compliance in both programs by cross-checking carrier information, such as reported mileage and jurisdictions of travel.

Flexible Configuration

Our software is designed to adapt to the way agencies run their businesses and administer IFTA. Through configuration, the software accommodates distinct agency and jurisdictional requirements, special licensing, fuel tax provisions, new legislation, and agency-specific correspondence.
